Dairy-Herd-Improvement Letter

ARS-44-40
(Vol. 34, No. 9)

September 1958

CONVERTING FEED INTO FOOD

A cow may be regarded as a machine converting raw material (inedible feed stuffs--particularly forage) into a finished product (edible food--milk and milk products).

Like machines, cows have different capacities. An alert factory foreman knows his machines, knows their capacity, the amount and kind of raw material each machine can handle satisfactorily and the most economical rate of operation of each machine, considering depreciation and replacement. Such a foreman will have complete records of performance on his machines. He cannot afford to guess. Similarly, a successful dairyman must know his cows, know their capacity to convert feed into milk. Generally, if a cow is given all the feed she can convert into milk and butterfat she will produce at maximum efficiency. To do this, cows must be fed according to production.

The dairyman has living machines in his milk-producing "factory." If he is to handle and operate his factory for maximum returns he must, like the factory foreman, have complete records on his operations. He can't afford to guess.

The dairyman with complete feed and production records on his cows and herd has the information needed to produce milk efficiently for maximum profitableness. Tens of thousands of DHIA members demonstrate this fact year after year.

On the following page is a tabulation showing, by States, the average milk and butterfat production and feed consumed per cow, based on the complete herd reports (780's) received for the DHIA testing year 1957-58.

SUMMARY OF THE 1956-57 DAIRY-HERD-IMPROVEMENT ASSOCIATION RECORDS, BY STATES ^{1/}

State	Herds	Herd	Average production			Average feed consumed			Concentrates	Average days on pasture
	on	Records				Roughage			fed per 100	
	test	used	Milk	Test	Fat	Succulent	Dry	Concentrates	lb. of milk

^{1/} Based on complete individual herd records, as reported by association supervisors.^{2/} Complete feed data not reported.^{3/} Changed testing year from calendar to fiscal year. Only one-half year reported.

DHIA PROVED-SIRE RECORDS TABULATED IN AUGUST 1958

Following is a list of 361 sires whose records were tabulated or retabulated by the Animal Husbandry Research Division in August 1958. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e. , *12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e. , *May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

Proved-sire records consisting of fewer than 25 comparisons with daughters resulting from artificial breeding are indicated as "preliminary AB proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
